
BOILERPLATE PROJECT

using Clean Architecture

Name: Sarthak Lembhe

Emp ID: 13557

ABOUT : RECIPE SHARING WEB-APP

- Here I have used Clean-Architecture as the main pattern for my coding standards .
- In this web-app we can add the dishes its recipe name , ingredients , procedure to make it and many more things.
- We have also made the web-app for user or admin specific by taking security measures.

SESSION 1

- Here I observed the pattern in which we have to do the project .
 - I understood the need for Global Exception handling.
 - Controllers for Api purpose was understood .
-

SESSION 2

- Now I used the code first approach to create my models and using auto-mapper I mapped the models to database.
- I used Repository Pattern inside persistence layer to implement the required Interfaces .
- Required packages were installed and references were made and using Db-Context the data was migrated,

SESSION 3

- Here I wrote the CQRS pattern for using mediatR to implement the required Recipe CRUD , wrote Commands ,Queries and their respective Command-Handlers.
 - Connected it to Repository layer(Persistence Layer).
-

SESSION 4

- Made the swagger helper classes and for API versioning.
 - Did the logs to get frequent messages in my case.
 - Made 2 folders named V1 , V2 to have different implementation of different controllers for example : user and admin .
-

SESSION 5

- Now I used JWT for authentication used JWT bearer for Authentication.
 - I implemented Refresh Token .
 - I also did token based Authentication.
-

THANKYOU
